Report No. 57

Genna M. Hurd
Co-Director, KCCED

Steven Maynard-Moody
Interim Director, Policy Research Institute

Foreword

The Kansas Center for Community Economic Development (KCCED) is a joint center of the Policy Research Institute at the University of Kansas and the Kansas Center for Rural Initiatives at Kansas State University. Its purpose is to enhance economic development efforts by bringing university expertise to rural Kansas.

KCCED is funded by a grant from the Economic Development Administration of the U.S. Department of Commerce. The statements, findings, and conclusions of this report are those of the authors and do not necessarily reflect the views of the U.S. Government, the University of Kansas, or any other individual or organization.

Economic Trends Update: Jewell County

Introduction

The following report is an objective look at several key economic trends occurring in Jewell County over the last few decades. We look at variables categorized under the following areas:

- population,
- employment,
- earnings and income,
- retail trade,
- agriculture, and
- education.

Throughout the report, Jewell County's performance is compared with the performance of the state of Kansas and other Comparative Counties.¹ It is by no means a comprehensive analysis of economic trends facing Jewell County but rather an overview of some key economic and demographic variables.

¹ "Comparative counties" or "Selected counties" used for comparison in this report are Cloud, Lincoln, Mitchell, Osborne, Republic, Smith and Washington counties.

POPULATION

In every community population size and economic activity are closely related. The size of population is directly related to employment opportunities within the area, wage differentials between regions, and a community's overall economic and social conditions. Growing communities are more likely to adapt successfully to a changing economic environment than areas with constant or decreasing population. New residents in a community mean additional consumers, taxpayers, and suppliers of labor. Without population growth, communities face problems of a tightening labor market, lack of new customers for businesses, a shrinking tax base, and an overall decline in economic activity. Generally, areas of population growth are also areas of economic growth, whereas areas of population loss suffered previous economic decline and restructuring.

Characteristics of the region's population are regarded as indicators of economic conditions and economic potential of this region. Past and projected population changes indicate economic trends in the community and can be compared to other counties, as well as the statewide and national averages.

Another characteristic of the economic potential of the region is migration of the population. Migration is linked to job opportunities and demand as well as wage differentials between regions. Counties with low rates of job creation and low wages will face higher worker mobility due to the lack of opportunity, or a "pull" phenomenon by urban areas with higher wages, better job opportunities, and a perceived better quality of life. Age and education also determine regional migration. Generally, the population aged 18 to 45 is the most mobile age group. The effect of education on migration is reflected by the movement of well-educated workers toward better job matches for themselves and their spouses and their attempts to raise their income levels by migrating to areas with employment opportunities.

The following section consists of population tables, figures, and maps, which together illustrate population totals, population growth rates, population by age groups, percent net migration, and population rankings.

Population: Key Findings

- The population of Jewell County has declined every decade for a hundred years. Between 1980 and 1990 Jewell County's population decreased by 18.9 percent, while the growth rate of Kansas was a positive 4.8 percent and that of the U.S. a positive 9.8 percent. In the decade of the 1990's Jewell's population slip was somewhat lesser, with total losses at -10.8 percent. This was the smallest percentage drop of any decade since 1930. This indicates Jewell County may be nearing a stable number beyond which it is difficult to decrease further. (Table 1 and 2, Figure 1b)

- All of the comparative counties also experienced population declines during the last three decades, although Jewell County fared the worst among them. Republic and Smith counties seem to have had population losses of quite nearly the same degree as Jewell County since 1970. Lincoln and Mitchell counties fared the best of the comparative counties, though they are certainly also struggling with retaining citizens. (Table 2 and Figure 1a)
- The largest age group segment in Jewell County in 2000 was made up of people in the 45 to 64 year-old range, a change from the way things were during the 1990 census. At that time, the largest age group was the 65 and over crowd. They made up 24.7 percent of the population in 1990 while only 22.5 percent were in the 45 to 64 group. In 2000 the number of people aged 45 to 64 had increased to 26.3 percent. In absolute numbers, that was the only group to see an increase in the last decade. These observations illustrate the effect of the aging baby-boom generation. (Table 3 and 3a and Figure 2)
- Census race data from 2000 can not be directly compared to data from previous years, due to a change in reporting which now allows people to select more than one race. In 2000, 28 people in Jewell County indicated they belonged to more than one race. Therefore, the 2000 Census data figures for individual races would probably be slightly higher if the old categorization had been used. Nevertheless, the new data is still useful for indicating trends. (Tables 4 and 4a)
- The population of Jewell County has become marginally more racially diverse over time. Although whites still make up the vast majority of the population (98 percent in 2000), their numbers have been decreasing. The race group which has seen the most growth has been the Hispanic segment, which approached one percent of total population in 2000. (Tables 4 and 4a)
- Each decade since the 1960's Jewell County's net migration has been negative. Net migration is calculated as the change in population less the difference between births and deaths. A negative net migration indicates that more people have moved out of the county than have moved in. Between 1990 and 1999 Jewell County's net migration was slightly negative at -254 people, or about 6 percent of total population. Compared to previous decades that decrease wasn't so bad. Jewell county lost a net number of 985 people in the 1960's, 681 people in the 1970's, and 879 in the 1980's. Net migration in Kansas from 1990 to 1999 was a positive 1.8 percent. It was the first time in four decades that the state of Kansas had a positive net migration. (Table 5 and Map 3)
- Jewell County moved from being the 52nd most populated county in Kansas in 1940 to being 73rd in 1980, 76th in 1990, and 79th in 2000. (Table 6, Jewell County not shown.)
- In 1990 the ten-year population growth rate in Jewell County was the worst of any county in Kansas. In other words, no other county in Kansas lost as big of a percent

of their population between 1980 and 1990 as did Jewell (-18.0 percent, Map1.)
Between 1990 and 2000, however, six other Kansas counties had populations which
decreased more than Jewell's -10.4 percent. (Map 2)

EMPLOYMENT

Economic vitality of every community is reflected in the employment situation. This section compares the key employment measurements such as labor force size, job creation rate, and unemployment in the Jewell County area with its comparative counties and the state of Kansas.

The number of people who are either working or willing to work determines the size of the labor force. This number is influenced not only by the size of population but also by the perceptions of individuals that suitable job opportunities exist within the community. Diverse healthy economies tend to offer the widest variety of job opportunities and thereby attract a large number of job seekers, which increases the size of the labor force.

The unemployment level reflects the amount of economic activity within an area and how well the local market is able to match the supply and demand for labor.

Job creation rates (net change in average annual employment) reflect the growth in employment levels and the range of employment opportunities. As some jobs are lost in a community due to changing economic circumstances, they may be replaced by new jobs. Net job creation reflects the net gain or net loss in jobs over a given period of time.

Place of work data compared to the place of residence data provide the insight of the employment opportunities within the area.

The following data include tables, maps, and graphs on employment growth rates, number of firms by number of employees, percentage distribution of firms by number of employees, employment levels by industry, labor force participation, unemployment rates, and job growth.

Employment: Key Findings

- Between 1990 and 2000 the average annual employment in Jewell County (U.S. Bureau of Economic Analysis data by place of work) fell from 2,044 employees in 1990 to 1,942 in 2000. All of the decline occurred in the second half of the decade. Employment actually increased 3 percent from 1990 to 1995, but dropped 7.8 percent from 1995 to 2000. (Table 7 and Figure 3)
- Employment in the comparative counties saw a similar trend in the 1990's. Most of them had employment increase slightly from 1990 to 1995; Osborne County's employment grew the most at 3.2 percent. From 1995 to 2000, however, the majority of the comparative counties saw declines. In this case, Osborne County again led the pack, with a decrease in employment of 11.8 percent. (Table 7, Figures 3 and 3a)

- The number of firms located in Jewell County increased 17 percent between 1988 and 1998, compared to a 12.6 percent increase for the state of Kansas over the same time period. (Table 8)
- The percentage distribution patterns of firms by the number of employees are more skewed to smaller firms in Jewell County than in the state as a whole (Table 8a). The vast majority of firms in Jewell County are small companies with less than 20 employees. Between 1988 and 1998 their number increased from 99 to 115. The percentage of medium-sized companies (up to one hundred employees) increased from four to six in the same time period. As of 1998 Jewell County did not have any firms employing 100 workers or more (Tables 8 and 8a). This data indicates the importance of small businesses to the local economy.
- Total industry-level employment for Jewell County stayed steady from 1993 to 1998, increasing only two jobs, or 0.1 percent. This is compared to a 13.5 percent growth rate for the state of Kansas during the same period of time (Table 9).
- From 1993 to 1998, farm employment, the largest employment sector in Jewell County, declined 12 percent, a loss of 95 jobs in five years. Farm employment also fell for the state, though not as much at only one percent. (Table 9)
- Other sectors which saw declines in Jewell County were Services (-2.5 percent) and Transportation (-4.2 percent.) Agricultural Services, Mining and Manufacturing also saw decreased employment, but final numbers are not available. When a sector gets to small enough information regarding it is suppressed by the Bureau of Economic Analysis for confidentiality reasons. (Table 9 and Figure 4)
- Three categories saw employment increases in Jewell County from 1993 to 1995: Construction gained 15 jobs, Finance, Insurance and Real Estate gained 28, and the Government Sector grew by 46 workers. (Table 9 and Figure 4).
- In 1998, Farming employed more people than any other sector in Jewell, with a 30.2 percent share of total employment. However, this percentage had decreased somewhat from 34.3 percent in 1993. Government was the second largest employer at 23.2 percent of the total. Following that were Services (12 percent) and Retail Trade (13 percent). The other industry sectors all employed less than ten percent each of the total. (Table 9a)
- Recent wage and salary employment estimates based on the place of work data show that employment of all industries in Jewell County fell 6.3 percent from 1998 to 1999. Employment estimates for the state of Kansas show a 1.3 percent increase from 1998 to 1999 (Table 9b).
- Place of residence data for Jewell County actually indicates a 0.2 percent increase in employment between 1998 and 1999. These figures are from the Kansas

Department of Human Resources, and as the name suggests, are based on the place of residence of individuals rather than their place of work. At the same time the civilian labor force fell by 0.9 percent, leading to a nearly 41 percent decrease in unemployment. (Table 9b)

- Comparing place of residence data and place of work data can indicate commuting trends. Table 9b shows that the number of jobs (place of work data) in Jewell County in 1999 was 1,103 less than the number of people employed in Jewell County in 1999 (place of residence data.) This could indicate that 1,103 people, or 54 percent of the number of employed people in Jewell County, commuted to a job outside of the county.
- The unemployment rate in Jewell County decreased from 2.7 percent in 1998 to a very low 1.6 percent in 1999. These rates are extremely low, but do not necessarily reflect wonderful conditions. As is often the case with rural communities, the very low unemployment rate indicates merely that most people who have not been able to find jobs have moved away, until the few left are simply those who can still be gainfully employed. (Table 9b and Map 5)
- In the state of Kansas total employment (place of residence data) increased by two percent between 1998 and 1999. A much smaller increase in the civilian labor force resulted in a 20.4 percent decrease in the number of unemployed. (Table 9b)
- The labor force participation rate is the percentage of population aged 16 and over that is in the labor force. The labor force participation rate in 1990 for Jewell County was 59.7 percent (Map 4). While relatively decent compared to other counties in Kansas, the participation rate was still somewhat lower than Kansas' rate of 65.4 percent and the U.S. rate of 64.4 percent (1990 U.S. Census.)

Earnings and Income

The economic base of the community is determined by the income of the community's residents. Higher average wages may indicate a greater number of jobs in high growth, high performance businesses. Low wage growth may indicate a higher concentration of stable or declining industries.

This report looks at two major components of earnings and income: average wage per job and per capita personal income. Average wage per job reflects the productivity of local labor and the performance of local businesses. Per capita personal income indicates the relative wealth of the area compared to the state. As the productivity of business and industry increases, personal per capita income also rises.

Earnings and Income: Key Findings

- In 1998 the average wage per job in Jewell County was \$16,056. That was \$10,194 less than the average wage for the state of Kansas and \$15,243 less than the national average (Table 10, Figure 5).
- Jewell's average wage per job compared somewhat better to the selected counties in 1998. It was higher than the average wage per job in Lincoln, Osborne, Smith and Washington counties, though the biggest difference among that group was only \$1,842. Cloud, Mitchell, and Republic counties all had average wages higher than Jewell's. At \$20,116 the average wage per job in Mitchell County was the highest of the group, and \$4,060 higher than Jewell. (Table 10 and Figure 5a)
- In the five year period between 1988 and 1993 the average wage per job in Jewell County increased 22.4 percent, the highest percentage increase of any of the comparative counties or the state of Kansas. Between 1993 and 1998 the average wage per job increased only 17 percent, which was about average. (Table 10)
- Per capita personal income in Jewell County in 1999 grew slower than the state's rate, and at \$22,750 was still behind the state's average of \$26,705 per year (Table 11). However, this difference is not so drastic as the difference in average wage per job. Historical data show that while per capita income in Jewell County has always been lower than the state average, the gap seems to have remained mostly the same since the late 1980's. (Figure 5b)
- In 1999 per capita personal income for Jewell County was in the mid range of levels seen in the comparative counties. Mitchell County had the highest per capita income of the group at \$24,466. (Map 6)

RETAIL

Retail trade is an important part of a community's business environment as well as source of revenues for the local governments. Retail trade is affected by a number of factors; for example, past decisions by investors, business managers, taxpayers, and policy makers contribute to a business climate which either promotes or inhibits the productivity of local businesses and therefore affects decisions about growth and expansion. Other contributing factors include the level of competition, the availability of suppliers and supporting industries, the cost of labor, and taxation and regulation within the community. Some types of establishments will thrive in an environment in which other firms cannot operate profitably.

The following section contains a table and a figure, outlining the retail sales growth rates.

Retail: Key Findings

- Taxable retail sales in Jewell County stood at \$9.1 million dollars in 1999, the latest year for which data is available. Retail sales growth rates were fairly erratic throughout the last decade, making it difficult to see any trend. Indeed, retail sales were nearly exactly the same amount in 1989 as they were in 1999. This compares to a decade growth rate for the state of 57 percent. (Table 12)
- For most of the 1990's the taxable retail sales growth rates in Jewell County have been less than those seen statewide. Figure 6 illustrates this trend. (Table 12 and Figure 6)
- Jewell County's trade pull factor in 2000 was a very low 0.28, in fact, this was the third lowest number in the state. A trade pull factor of less than one means the county lost more retail activity to other counties than it was able to 'pull in'. All of the comparative counties had pull factors of less than one, though none so low as Jewell's. No doubt many residents of these counties travel to Salina or perhaps Nebraska to shop, making it difficult for them to retain much in the way of retail dollars. (Map 7)

AGRICULTURE

The economic well-being of Jewell County has historically been tied to the agriculture/farming sectors. This section looks at the level of activity in agriculture and examines how the character of this industry is changing in the county.

The agriculture section contains two tables on the total value of field crops and the total value of livestock and poultry.

Agriculture: Key Findings

- Nearly every comparative county as well as the state as a whole saw sharp declines in the value of field crops in 1997 and 1998. In Jewell County, after reaching a high of \$48.4 million in 1996, the value of field crops fell 13.2 percent in 1997 and another one percent in 1998, bringing the value down to \$41.6 million. That value was less than what it was for the county in 1995. The county with the highest valued crops in 1998 was Washington County at \$49.3 million, followed by Republic County at \$37.2 million. The county with the lowest value of field crops in 1998 was Lincoln County at \$30.1 million. (Table 13)
- The total value of livestock and poultry in Jewell County in 1998 was only \$14.4 million, a decrease of almost 20 percent from 1995. All of Jewell's livestock value decline happened in 1998. The year before the value had reached a high of \$22.2 million. Most of the other comparative counties saw significant declines in 1998 as well. (Table 14)

EDUCATION

The educational level of residents is likely to influence the well being of the whole community. Communities able to provide a higher skilled workforce are more likely to benefit from new developing industries. Residents who have a good educational background will be more employable and able to command higher salaries. Employers will benefit as well because they will most likely experience lower turnover and training costs. On the other hand, individuals with lower education levels have a harder time finding jobs that can supply a living wage and may be more likely to use social services.

Education: Key Findings

- As with many rural communities, Jewell County has a higher percentage of high school graduates than the state of Kansas, but a lower percentage of college graduates. In 1990, the last year for which data is available, 41 percent of the population in Jewell County had obtained their high school diploma, compared to only 33 percent for the state of Kansas. However, the percentage of people in Jewell County who held either bachelor's or graduate's degrees was about half the percentage seen in the state as a whole. (Table 15)
- In 1990, 60.4 percent of the over-25 population in Jewell County had no higher than a high school education, compared to 51.6 percent of the over-25 population in Kansas. (Table 15)
- Jewell County graduated roughly 50 high school students on average each year from 1990 to 1999. The number of high school drop-outs each of those years fluctuated from a low of zero to a high of five. (Table 16)
- High school drop-outs as a percent of graduates in Jewell County averaged about three percent a year from 1990 to 1998. The average rate for Kansas was 23.6 percent. This indicates the quality of Jewell County's education system. (Table 16)

CONCLUSION

Economic data is an important tool of the community economic development process because it gives community members a better view of the current facts and trends in different areas of economic and demographic performance of the community. However, numbers alone are not enough. The data must be analyzed and interpreted, taking into account the intuition of those within the community as to what the trends really mean. In other words, economic data serve as the foundation for analysis which concludes: 1) what is happening in the community relative to other regions over time, and 2) what potential impacts or consequences can be inferred from the data. A simplified look at the previous data would conclude the following:

Population in Jewell County has been declining since the beginning of the century. Population analyses of Kansas counties have indicated that many rural counties have seen their populations decline to a low number, usually around 4,000 residents, and from there a period of long term, relative stability is experienced. Jewell County seems to have been a part of this trend. The extremely low unemployment rates in the county also fit this pattern: they indicate very few new jobs are available, and only those residents able to work have remained. At some time population will decline to the level of jobs that must remain, and then stabilize. If this point has not yet been reached in Jewell County, it is near.

The number of firms in Jewell County increased slightly over the last decade or so, however, at the same time total employment decreased. This would suggest that while some small number of new firms have begun, they employ very few people, and of the firms that already existed, they have downsized their number of employees. It is also interesting to note that quite likely nearly half of the employed people who live in Jewell County commute out of the county to work. This indicates that much of Jewell County's fortune is tied to the fortunes of the surrounding communities.

Jewell County is primarily an agricultural community. Farming employs the most people there, and the majority of the other jobs are auxiliary to that function. As long as agriculture remains a viable activity, population and employment conditions similar to the current levels will likely be maintained. However, those levels will continue to be correlated to the relative prosperity of farming activity unless the county develops additional and self-supporting employment bases.
